# Introduction

## Miami Valley Land Use Demand Assessment

### Purpose

The Miami Valley Regional Planning Commission (MVRPC) conducted the Miami Valley Land Use Demand Assessment as the culmination of the non-physical existing conditions evaluation of “Going Places - An Integrated Land Use Vision for the Miami Valley Region.” The main purpose of this assessment is to project future land use demand based on the continuation of existing demographic, economic, and development trends.

### Study Area

The study area covers a three county Region in the Dayton Metropolitan area, along with three cities in northern Warren County, located in southwest Ohio (Figure 1). It includes Greene, Miami, and Montgomery counties along with the cities of Carlisle, Franklin, and Springboro in Warren County, covering approximately 1,313 square miles with three interstates, I-70, I-75, and I-675.

Figure 1. Study Area

### Report Structure

This report begins with descriptions of the sources and general methodology used, including a summary of the transformation of existing data into projections. In the following section, the results from the socio-economic forecasts that form the base of this assessment are presented. Next, the base data and assumptions employed to translate the socio-economic projections into future land use demands are reviewed. It concludes by presenting the results of the land use demand projections in terms of how much land development could be needed in the future if existing trends continue.

### Acknowledgements

This study was made possible by datasets that were made available from various sources listed throughout this report. MVRPC is grateful for this data and would like to thank those organizations for making the data available.

# Methodology

## Miami Valley Land Use Demand Assessment

The projections presented in this report were calculated in two stages. First, population and employment projections were developed for the Region. Second, these two sets of projections were used to calculate land use needs for the Region. For both the socio-economic and the land use demand projections, the year 2040 was the planning horizon year.

### Population and Employment Projections

The population projections to 2030 were taken directly from the Ohio Department of Development's (ODOD) population projections for Greene, Miami, and Montgomery counties. These projections were then extended to 2040 in order to meet the horizon year. For Warren County, since only the cities of Carlisle, Franklin, and Springboro are included in the planning boundaries, an average percentage of the population in these three cities in comparison to the county was developed based on historic population data. This percentage was then applied to the ODOD county-level population projections in order to calculate the future population for those three cities to 2030. This projection was then extended to 2040.

Two different employment projections were developed, one high and one low, in order to provide a forecasted employment range. Both are based on data gathered from ODOD, the Ohio Department of Jobs and Family Services (ODJFS), and data purchased from Woods & Poole. The projections were, for Greene, Miami, and Montgomery counties, made at the county level. County employment totals were calculated first, and then these totals were broken down into ten Standard Industrial Classification (SIC) categories based on data purchased from Woods & Poole.

The only exception to this method is the Warren County employment projection. Projections for the cities of Carlisle, Franklin, and Springboro to 2030 were provided by the Ohio, Kentucky, Indiana Regional Council of Governments (OKI). MVRPC staff then extended these forecasts to 2040. Because of this, there is only one projection for Warren County.

The lower level projection is the projection that has been used in MVRPC's 2030 Long Range Transportation Plan, although for this assessment it was extended to 2040 and a new division among SIC categories, based on data from Woods & Poole, was applied.

The upper level projection was calculated in two stages. First, a short term projection to 2010 was calculated using both adjusted historical data from the Quarterly Census of Employment and Wages and the ODJFS 2014 employment projection (including the 2004 employment number on which it is based). Second, using this same data, a linear projection to 2040 was calculated and the 2020 and 2030 numbers were placed on a line that extended from the 2010 projection to the 2040 projection. The total employment projections by county were divided into SIC categories using the same method used for the lower level projections.

### Land Use Demand Projections

The land use demand projections were calculated at the county level and then aggregated to the regional level based on the 2040 population and employment projections and the assumption that development in the Region would continue at the same densities and intensities that were represented in 2007. The method follows, with some modifications, the method outlined in Arthur C. Nelson's *Planner's*

# Methodology

## Miami Valley Land Use Demand Assessment

*Estimating Guide: Projecting Land-Use and Facility Needs.* A base year of 2007 was used for most of the calculations, although in some cases 2007 data was not available and data from other years (most often 2008, 2006, or 2000) had to be substituted.

Nelson's approach divides the projections into five different categories, all of which are discussed in more detail below:

- Residential
- Employment
- Public Facilities
- Education
- Water and Wastewater Utilities

Data were obtained from a variety of different sources. The primary sources were the county Auditors' parcel-level data. Other sources include:

- U.S. Census Bureau
- Ohio Department of Development
- Ohio Department of Jobs and Family Services
- Ohio EPA, Division of Surface Water
- National Center for Education Statistics
- A variety of local sources, including water facilities superintendents and school districts

**Residential Land Use** – For this category, projections were calculated separately for single and multi-family housing units. For single family housing units, the projections were based on data from the 2007 parcel database. For multi-family housing units, 2007 American Community Survey (ACS) data from the Census Bureau was used to supplement the 2007 parcel data. For both types of housing units, data from the ACS were used in order to divide the 2007 population number among the housing types. All 2007 densities were held constant to 2040.

In order to calculate the residential land use needs, the first step was to inventory the existing residential land use using the 2007 parcel database. Second, numbers of occupied units and residents were estimated using both information from the 2007 parcel database and the ACS. Third, residential acreage was determined using the 2007 parcel database. Fourth, the projected number of residential units needed for 2040 was calculated based on the 2040 population projections and the calculated persons per household, held constant from 2007. Fifth, future residential land use needs were determined based on the projected number of housing units needed and average densities held constant from 2007.

**Employment-Related Land Use** – Because two employment projections were calculated, two land use projections for land related to employment were calculated as well. The 2007 parcel database was the primary source of data for the projection of this category.

As with the residential land use needs projection, the first step was to inventory existing employment-based land use from the 2007 parcel database. Second, gross square footage per employee and floor area ratios (FARs) were then calculated for 2007 by SIC category. These ratios were applied to the 2040 employment projections in order to calculate the land use needs for this category.

# Methodology

## Miami Valley Land Use Demand Assessment

For Greene and Montgomery counties, the employment-related land use projections had to be adjusted so that land for Wright Patterson Air Force Base (WPAFB) was not projected along with everything else. In order to accomplish this, neither land nor employment for 2007 and 2040 for WPAFB were included in the projections. The acreage was added back into both counties' total developed acreage for 2007 and the total acreage needed for 2040 after the projections were calculated.

**Public Facility Land Use** – Future land use demands for basic services — fire/emergency medical services and police facilities — were based on population projections and current levels of service. Land for all other public facilities, including jails, leisure facilities, major community facilities, parks and open space, miscellaneous support, and religious facilities, were not projected. These facilities are regarded as non-basic services that exist at the will of the public.

For the projections of both fire/emergency medical services and police facilities, the acreages for each type of facility were obtained from the 2007 parcel database and then divided by the 24/7 functional population for 2007. This ratio was then applied to the projected 24/7 functional population for 2040 in order to calculate the future acreage needed for these types of facilities.

**Educational Land Use** – Only the acreage needed for public primary and secondary schools was projected to 2040. The 2007 acreage for private primary and secondary schools, public and private post-secondary schools, and for auxiliary facilities were all held constant to 2040.

Future land use projections for public primary and secondary schools were based on enrollment projections, which were based largely on population projections. Levels of service for school facility space were taken from the Ohio School Facilities Commission's (OSFC) standards for school design.

The method for the educational land use demand projections is based on school planning guidelines from the OSFC. The floor area ratio (FAR) was calculated for each school category, i.e., elementary (kindergarten through 5th grade), middle (grades 6 through 8), and high (grades 9 through 12), for each county and for the Region as a whole. Not all schools in the Region fit neatly into these categories. Therefore, for some schools, estimates had to be calculated based the percentage divisions between grades from the 2007 enrollment numbers. The following standards were then applied in order to estimate future facility space needs:

- For elementary schools, the OSFC allocates 115.6-125 square feet per student (115.6 was used)
- For middle schools, the standard is 141-151 square feet per student (141 was used)
- For high schools, the standard is 156-180 square feet student (156 was used)

The facility space needed, along with the FAR, was used to determine the total land needed in 2040. Note that this calculation assumes each school is currently at full capacity.

**Water and Wastewater Utility Land Use** – Data regarding water and wastewater utilities' capacities and demands was acquired from local water facility operators and from the Ohio EPA, respectively. Capacities for water and wastewater at the county level were determined to be sufficient for future demand; therefore additional land for these types of facilities was not allocated in projections for 2040. However, local needs may differ from those projected at the county or regional level, and so future expansions may be necessary to meet local demands.

# Socio-Economic Forecasts

## Miami Valley Land Use Demand Assessment

### Population Forecasts

On a regional level, between 2000 and 2040, the Region's population is expected to grow by less than 3%. All counties but Montgomery are projected to gain population, with the three cities in Warren County expected to nearly double in population between 2010 and 2040 (Table 1).

**Table 1. Regional Population Projections: 2000-2040**

	2000	2010	2020	2030	2040**	Percent change 2000-2040
<b>Region</b>	834,717	836,494	844,648	855,137	859,063	2.9%
<b>Greene</b>	147,890	151,760	156,590	158,860	163,330	10.4%

 \*\*MVRPC projected

### Employment Forecasts

As mentioned in the methodology, two employment projections were developed, one upper and one lower. Figure 2 shows the regional total employment projections from 2000 to 2040, highlighting the range between the two projections. At the upper end of the range, regional employment could reach 519,182 by 2040, an increase of almost 19% from 2000. Alternatively, at the lower end of the range, employment could reach 458,384 by 2040, an increase of only 5%.

**Figure 2. Regional Employment Projections: 2000-2040**

Source: MVRPC; OKI

Tables 2 and 3 present the employment projections by county. The lower level projection has Montgomery County actually decreasing in employment (-4.6%). For the upper level projection, all counties are projected to have increases in total employment, with the three cities in Warren County growing by the largest percentage (76%) and Montgomery County growing by the smallest percentage (8%).

**Table 2. Lower Level Employment Projections by County: 2000-2040**

	2000	2010	2020	2030	2040	Percent change 2000-2040

# Base Data and Assumptions

## Miami Valley Land Use Demand Assessment

Before presenting the land use demand projection results, it is necessary to take a more detailed look at some of the base data that was used and some of the assumptions that were made in the course of the calculations. The sections that follow present examinations of the base data and assumptions at both the regional and county levels.

### Residential Land Use

Tables 6 through 10 show the base data and assumptions for the residential projections. In order to project the residential land needed in 2040, single family housing units were divided into four density categories. All multi-family housing units were considered in the same category.

For single family housing units, the number of units was derived from the 2007 parcel database. The number of multi-family units, however, was not included in the parcel database and had to be obtained from the 2005-2007 American Community Survey 3-Year Estimates (ACS). For both single and multi-family housing units, the acreage was determined using the 2007 parcel database.

Vacancy rates were calculated based on data from the ACS and were held constant to 2040. The estimated household sizes were calculated based on population data from the ACS and the number of units from the 2007 parcel database. These were also held constant to 2040.

Table 6 shows that almost 82% of the housing units in the Region are single

**Table 6. Regional Residential Land Use Data: 2007**

	Housing Units	Acres	Vacancy Rate	Estimated Household Size
<b>Single Family</b>				
<1 Units Per Net Acre	36,116 (10.7%)	80,740	6.61%	2.65
1-2 Units Per Net Acre	86,769 (25.8%)	46,140	6.61%	2.66

# Base Data and Assumptions

## Miami Valley Land Use Demand Assessment

family. In terms of acreage, those single family housing units with more than one acre per unit (<1 Units per Net Acre) occupy the largest amount of land, while single family housing units with 6 units or more per acre occupy the smallest amount of land. Not surprisingly, vacancy rates for single family housing units are much lower than those for multi-family units. Household sizes for single family units are lower as well.

### Employment-Related Land Use

The base data for the employment-based land use projections came mostly from the 2007 parcel database (Tables 11 through 15). For this projection, employment was categorized into one of two major classifications: Industrial or Commercial. Industrial employment includes the SIC categories for Manufacturing and Transportation, Communications, and Utilities (listed as 'Trans, Comm, Util' in the employment tables). Commercial employment includes Construction, FIRE, Public Service, Retail, Services, and Wholesale. Land use needs for Agriculture and Mining were not projected.

Square footage per employee was calculated using building square footage data obtained from the 2007 parcel database and the employment projections. Even though 2007 is the base year for this assessment, 2000 was the base year for the

## Miami Valley Land Use Demand Assessment

employment projections, and so the 2007 employment numbers had to be interpolated based on the 2000 and 2010 projections. For this reason, for all counties except Warren, there is a square footage per employee number for each end of the projection range.

The 2007 acreage data comes directly from the 2007 parcel database and the floor area ratios (FARs) were calculated using the square footage and acreage data. The vacancy rates, however, were adapted from the Gem Real Estate Group's 2007 market analyses for industrial, retail, and office development.

Overall, industrial development has a larger amount of square feet per employee than commercial development, and the vacancy rates are higher as well. The differences in the floor area ratios indicate that generally there is more building square footage per acre for retail and office development than for industrial development.

### Public Facility Land Use

In order to project land use needs for public facilities, it was necessary to determine the 24/7 functional population for each county (Table 16). This was calculated using the population and employment projections and journey-to-work data used in MVRPC's 2030 Long Range Transportation Plan.

The 2007 square footage and acreage for each of the public facility categories came mostly from the 2007 parcel database. In the case of libraries in Montgomery County, however, the library systems were contacted for the square footage data.

By far the largest portion of the land allocated to public facilities is classified as parks and open space. Outside of parks and open space, the most land-intensive uses are religious facilities and private golf courses.

### Educational Land Use

Tables 17 and 18 present the base data and assumptions for primary and secondary schools and post-secondary schools in the Region, respectively. For all schools, the number of students was obtained from the National Center for Education Statistics and the acreage came from the 2007 parcel database. For primary and secondary schools, square footage data was obtained directly from the school districts. The Level of Service (LOS) facility space per student comes from the lower range given by the Ohio School Facilities Commission's *Ohio School Design Manual*.

In terms of primary and secondary schools, the largest number of students and facility square footage are found in the elementary schools. The largest acreage, however, occurs at the high school level.

# Base Data and Assumptions

## Miami Valley Land Use Demand Assessment

### Water and Wastewater Utilities

Data for water and wastewater utilities came from three sources. For water supply facilities, capacity and demand data were collected from the facilities themselves. For wastewater facilities, capacity and demand data were obtained through the Ohio Environmental Protection Agency. Facility acreage came from the 2007 parcel database.

In terms of water supply, regional demand in 2008 was less than half of regional capacity. The demand for wastewater treatment was much closer to the Region's capacity, but still almost 50 million gallons per day (mgd) below capacity.

**Table 19. Water and Wastewater Utility Data: 2007**

Region	Water Supply		Wastewater		Facility Acres, 2007
	Capacity, mgd*, 2008	Demand, mgd*, 2008	Capacity, mgd*, 2007	Demand, mgd*, 2007	
<b>Region</b>	238.04	101.93	182.87	132.95	2,201

\*\*Warren County includes only the cities of Carlisle, Franklin, and Springboro

# Land Use Demand Assessment Results

## Miami Valley Land Use Demand Assessment

### Regional Land Use Projection Results

As mentioned above, two projections, lower and upper, were used to account for a range in employment projections. These figures therefore resulted in two sets of projections for the employment and facilities categories.

**Table 20. Regional Land Use Projection Results by County**

Region	Total Developed Acreage 2007	Lower Level Total Acreage Needed 2040	Percent Change 2007-2040	Upper Level Total Acreage Needed 2040	Percent Change 2007-2040
Region	275,709	283,253	2.7%	292,121	6.0%
Greene	73,696	77,799	5.6%	78,958	7.1%
Miami	63,512	67,080	5.6%	68,394	7.7%
Montgomery	130,715	130,956	0.2%	134,593	3.0%
Warren*	7,786	13,038	67.5%	13,038	67.5%

Source: MVRPC  
Note: \*Warren County includes only the cities of Carlisle, Franklin, and Springboro

As a whole, the Region can expect to need between 2.7% and 6.0% more developed land by the year 2040 (Table 20). Warren County is expected to see the largest increase in need, with 67.5%, but land use demand in Montgomery County is expected to increase only by between 0.2% and 3.0%.

**Table 21. Regional Land Use Projection Results by Land Use Category**

Land Use Category	Lower Level Additional Acreage Needed 2040	Upper Level Additional Acreage Needed 2040
Residential	6,421.1	
Employment	0.0	8,859.2
Facilities	11.5	20.6
Education	1,111.3	
Water and Wastewater	0.0	
<b>Total</b>	<b>7,543.9</b>	<b>16,412.1</b>

Source: MVRPC

Examining the projections by land use category shows that for the lower level projection, the land use category with the largest absolute increase is residential (Table 21). For the upper level projection, the largest absolute increase belongs to the employment-related land use category. It is important to note that not all elements of the five land use categories were projected. For example, only two categories of facilities were projected and no projections were made for Water and Wastewater facilities.

### Residential Land Use Projection Results

Table 22 is a summary of the residential acreage need in 2040 and the percent changes between 2007 and 2040 by county. Overall, the Region is expected to need 3.8% more residential land in 2040. The three cities in Warren County are expected to need the largest increase in residential land (101.6%). On the other hand, the amount of residential land needed in Montgomery County is expected to decrease by -3.4%.

**Table 22. Residential Land Use Projection Results by County**

Region	Developed Residential Acreage 2007	Residential Acreage Needed 2040	Additional Acreage Needed	Percent Change 2007-2040
Region	167,446	173,867	6,421	3.8%

Note: \*Warren County includes only the cities of Carlisle, Franklin, and Springboro

Total employment in the Region is projected to increase by 1.5% to 23% from 2010 to 2040. This represents an addition of between 6,957 and 96,343 jobs. Manufacturing and agriculture, and possibly public service are expected to lose jobs over this period; services, transportation, and construction sectors are anticipated to grow the most. Note, however, that because different job sectors have different space requirements, the amount of land used for employment changes not

only in response to changes in the total number of jobs, but in response to the change in percentage of the types of jobs. Specifically, industrial jobs in the Region take about 959 square feet per employee whereas commercial employees take about 398. Therefore, the decrease in industrial employment results in a lower overall demand for space.

Table 25 is a summary of the land that will be needed to accommodate the changes in employment numbers for the Region as a whole and by county. The Region will experience a demand between -3.3% and 25.1% for more land for employment-related land use in 2040. In the lower level projections, Montgomery County is projected to need less land for employment-related land use than it had in 2007. The three cities in Warren County will see the highest percent increase in land demand. In the upper level projections, all of the counties show an increase in the land needed, although Miami and Montgomery

# Land Use Demand Assessment Results

## Miami Valley Land Use Demand Assessment

counties have the smallest percent increases, with 27.1% and 15.5%, respectively. The largest percent increase is projected to occur in Greene County.

Table 26 shows the land needed to accommodate the 2040 employment projections by employment category and by county. Table 27 provides the percent changes in the land needed for employment-related land uses between 2007 and 2040.

Regionally, for the lower projection, industrial employment-related land uses are projected to decrease by more than 10% between 2007 and 2040; commercial employment-related land uses are expected to decrease by 0.3%. For the upper projection, industrial employment-related land uses are projected to increase by 6.5% and commercial employment-related land uses are expected to increase by over 33%.

\*\*Includes FIRE, Services, and Government SIC categories

Losses are seen in manufacturing employment-related land use for both the lower and upper level projections in all counties except Warren, for which manufacturing employment-related land use is projected to increase by over 68%. The lower level projection also shows decreases in retail employment-related land use for Miami and Montgomery counties. Overall, the largest percent increases in employment-related land use for all categories are projected for Greene County's upper level projection, and Warren County's projection.

# Land Use Demand Assessment Results

## Miami Valley Land Use Demand Assessment

### Public Facilities Land Use Projection Results

As Table 28 shows, acreage used for facilities is substantial, but additional land needed in 2040 is not, due to the fact that only fire/EMS and police facilities – a small proportion of the land in the facilities category – were projected.

**Table 28. Public Facility Land Use Projection Results**

	Region		Greene		Miami		Montgomery		Warren*
	Lower proj.	Upper proj.	Lower proj.	Upper proj.	Lower proj.	Upper proj.	Lower proj.	Upper proj.	
<b>Fire/EMS Facilities Acreage</b>	133.2	137.9	23.7	24.5	25.3	26.2	75.9	78.9	8.3
<b>Police Facilities Acreage</b>	129.0	133.4	7.6	7.8	3.5	3.7	99.8	103.8	18.1
<b>Total Facility Acreage 2040</b>	48,507.6	48,516.6	12,753.9	12,754.9	7,334.5	7,335.5	27,507.2	27,514.2	912.0
<b>Total Facility Acreage 2007</b>	48,496.1		12,750.9		7,332.5		27,513.5		899.2
<b>Percent Change 2007-2040</b>	0.02%	0.04%	0.02%	0.03%	0.03%	0.04%	-0.02%	0.00%	1.42%

Source: MVRPC

Note: \*Warren County includes only the cities of Carlisle, Franklin, and Springboro

As a whole, the Region can expect to need between 0.02% and 0.04% more acreage for public facilities in 2040 as compared to 2007. The projections for both the upper and lower level projections for Greene and Miami counties fall within this range. Montgomery and Warren counties, however, do not. Montgomery County, due to a projected population decrease, is not projected to need any more land for public facilities in 2040. The three cities in Warren County, however, are projected to have a relatively large population increase, and therefore will need 1.42% more land for public facilities in 2040.

### Educational Land Use Projection Results

Table 29 shows the change in enrollment for public primary and secondary schools between 2007 and 2040. Only public primary and secondary schools were projected; enrollment and land needed for other types of educational facilities were held constant from 2007. Table 30 shows the projections for land needed in 2040 for educational facilities.

**Table 29. Percent Change between 2007 and 2040 for Public Primary and Secondary Enrollment**

	Region	Greene	Miami	Montgomery	Warren*
<b>Public Primary &amp; Secondary Schools 2007</b>	129,424	22,338	17,078	80,310	9,698
<b>Public Primary &amp; Secondary Schools 2040</b>	167,771	33,540	24,059	94,811	15,360
<b>Percent Change 2007-2040</b>	29.63%	50.15%	40.88%	18.06%	58.39%

Source: MVRPC

Note: \*Warren County includes only the cities of Carlisle, Franklin, and Springboro

The total number of public elementary and secondary students in the Region is expected to rise by almost 30%, and acreage demand is expected to rise by 28.67%. This indicates that as a whole, the Region has slightly more facility space than students currently, and so can absorb some increase in students without needed the given demand for facility acreage.

Note that the OSFC's equation for gross square footage for a school building actually gives a range, on a sliding scale; for this report, we used the lowest number in that range in our calculations. However, the OSFC does note, "The sliding scale allows for the fact that larger buildings that must be provided for larger student populations are more space efficient and require fewer square feet per student." The variation in school sizes across the region can certainly affect acreage demand. Not all schools in the

# Land Use Demand Assessment Results

## Miami Valley Land Use Demand Assessment

region can support a larger, more space-efficient building, in which case the fundable square footage will rise, as will the acreage.

# Conclusion

## Miami Valley Land Use Demand Assessment

The Miami Valley Land Use Demand Assessment connects and completes the various investigations regarding non-physical conditions carried out as part of Phase I of “Going Places – An Integrated Land Use Vision for the Miami Valley Region.” This report presents the assessment in three stages: the calculation of the socio-economic projections, the collection of the base land use data, and the calculation of the land use demand projections.

The land use demand projections were based on the assumption that the Region would continue to develop at the same densities and intensities that were present in 2007. For the Region as a whole, developed acreage may need to increase by between 2.7% and 6.0%, or between 7,544 and 16,412 acres. This is approximately equivalent to one to two times the size of Wright Patterson Air Force Base.

Highlights of this assessment include:

- The Region’s population is expected to increase by less than 3% between 2000 and 2040
- Two different employment projections were developed, one high and one low, in order to provide a forecasted employment range. At the lower end of the range, the increase could measure approximately 5%. At the upper end of the range, employment could increase by almost 19% between 2000 and 2040.
- Regionally, residential acreage is projected to increase by 3.8%.
- The dominant sectors of employment will change as the manufacturing sector continues to decline and the commercial sectors, particularly the services sector, continue to increase.
- Due to the different space requirements of the different employment sectors, even though at the lower projection level employment is expected to increase by 5%, no additional land is projected to be required. At the upper projection level, employment-related land use needs are expected to increase by 25%.
- The total number of public elementary and secondary school students is expected to rise by almost 30% and the land needed to accommodate those students is expected to increase by almost 29%.
- Only a selection of land use categories were projected. For those not projected, such as Water and Wastewater Utilities, it is acknowledged that even though at a regional level it is realistic to assume that no additional land will be needed, at a local level this may not be realistic and additional land for these types of development may be needed.

Due to the modest increases projected for the Region’s population and employment, an equally modest amount of additional developed land is projected to be needed in 2040. This analysis, however, is meant to provide a base from which to move into Phase II: Future Land Use Scenario Development and Assessment. There are many ways in which these projections may change as the Going Places initiative moves into the scenario development process. Several elements of these projections, such as assumed vacancy rates, household sizes, and floor area ratios – all of which were held constant to their 2007 levels – could be altered, which would alter the projected land use demand.
